PREPARATION OF IODIXANOL

A process for the preparation of iodixanol by dimerisation of 5-acetamido-N,N'-bis(2,3-dihydroxypropyl)-2,4,6-triiodo-isophthalamide ("Compound A") in which, after the dimerisation step, unreacted Compound A is precipitated from the reaction mixture
10 and recovered for re-use. The process substantially increases the net yield of iodixanol and simplifies its purification.
